                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     QY
                                                                                                                                                                                                    CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, cligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II), (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II), (I) and (II) are useful in redical CC disgonstics, gene mapping, identification of mutations in CC diagnostics, forensics, gene mapping, identification of mutations compositions, for enettic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed content wince in the number of the formal of the polypear of the invention.

                                                                                                                                                                                                   polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   programmed cell death (PCD; apoptosis). The coding sequences and proteins of the present invention are useful for modulating a PCD or cell death pathway and various developmental pathways in a forestry plant, by stably incorporating one of the present coding sequences into the genome of the forestry plant, where the coding sequence provides a PCD pathway that is not present in a native form of the forestry plant.

Positions in the alignment are assigned to the surface or inside of the folded structure, active sites, and parsing segments. Secondary structural units are assigned by identifying periodicity in the assignments, and assembled into globular form using distance constraints imposed by disulfide bridges, active site assignments and co-variation analysis. The predicted secondary structures are useful for identifying antigenic sites on a protein molecule, as guides for site directed mutagenesis studies, and for understanding the interaction of a protein with other molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Column 305-308; 113pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and to produce other types of data and products dependent on DNA and amino acid sequences. AB600010-AB630377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy technique
                                                                                                                                                                                                                                                                                                                     MADER protein; growtl cancerous condition;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 20; SEQ ID No 38845; 103pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC sequence being short splice variant. The DNA encoding the present CC sequence has a deleted internal sequence, producing a frameshift CC that causes premature termination of translation. Termination results in CC the loss of approximately one-third of the full length 525 amino acid CC MADER molecule. Analysis of human placental DNA has revealed that this CC alternatively spliced form of MADER is found in a 1:1 ratio with the CC full length version. The shorter MADER has an altered function and fails CC to repress erg-lactivity. Chromosomal rearrangement of MADER can be CC detected by hybridising immobilised chromosomal target DNA, that has been rendered single stranded and is obtained from a cell suspected of CC having undergone a MADER translocation event with a single stranded CC oligonuclectide probe complementary to a MADER nucleotide sequence. The CC cancerous condition, particularly melanoma malignancies, and especially CC abreast carcinoma. A composition comprising a MADER immunogen and a CC pharmaceutically acceptable vehicle can be used to elicit an immune corresponse against a cell which over-expresses a MADER antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

This nuclear protein is associated with growth alterations in malignant melanomas and other cancerous conditions, and is over-expressed in human malignant melanomas. Several variants of the protein have been identified (AAW24228-31), the protein have been identified (AAW24228-31).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure;

Hiss polypeptides, or vectors for their expression, can be used prophylactically in vaccines to raise an antibody and/or T cell immune response against these same diseases. Additionally, the new polypeptides allow agonists and antagonists of hiss to be identified wising standard binding assays. The compounds which are identified may have useful bacteriostatic and/or bacteriocidal activity. Antibodies against hiss can used to treat infection, isolate or identify hiss expressing clones, purify hiss and as an immunoassay reagent. More generally, the products can prevent adhesion of bacteria to wounds and in-dwelling devices, block hiss protein mediated invasion of mammalian cells and block the normal progression of infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           QY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC The present sequence represents a novel melanoma associated delayed CC early response (MADER) protein. This 55 kDa nuclear protein is associated CC with growth alterations in malignant melanomas and other cancerous CC conditions, and is over-expressed in human malignant melanomas. Several CC variants of the protein have been identified (AAW242831), the present CC protein being the Drop8 splice variant. The protein contains repeat CC contists which are characteristic of gene regulatory DNA binding proteins. CC immosomal rearrangement of MADER can be detected by hybridising CC immobilised chromosomal target DNA, that has been rendered single stranded and is obtained from a cell suspected of having undergone a CC MADER translocation event with a single stranded oligonucleotide probe CC capable of direct or indirect visualisation. Antibodies raised against the MADER protein can be used for detecting a cancerous condition, CC capable of direct or indirect visualisation. Antibodies raised against CC composition comprising a MADER immunogen and a pharmaceutically CC acceptable vehicle can be used to elicit an immune response against a CC conte: the present sequence is not given in the specification; it was CC created using information provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromosography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for

This sequence represents a Streptococcus pneumoniae histidyl tRNA synthetase (hiss) amino acid sequence. tRNA synthetases have a primary role in protein synthesis, and inhibitors of bacterial
                                                                                   Histidyl t-RNA synthetase enzyme from streptococcus genus useful for treating diseases such as otitis media, conjunctivitis, pneumonia, bacteraemia, meningitis, sinusitis, pleural empyema and endocarditis
                                                                                                                                                                                                                                                                                                                                                                                                                            Histidyl tRNA synthetase; conjunctivitis; bacteraem:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a Streptococcus pneumoniae histidyl trNA synthetase (his5). The protein has homology to a S. equisimilis his5 protein. Fragments of hiss that retain binding and/or catalytic properties are used for research as novel targets against S. pneumoniae. The hisS nucleic acid sequence (and primers and probes derived from it) are used to isolate related genes, to diagnose disease, specifically S. pneumoniae infection (e.g. otitis media, pneumonia, conjunctivitis, osteomyelitis or especially meningitis, possibly also infections by Helicobacter pylori and associated tumours), to identify mutations or polymorphisms for serotyping, and antisense sequences are potential

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          26-MAY-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     tRNA synthetase polypeptide sequence of the invention is useful for treating diseases such as otitis media, conjunctivitis, pneumonia, bacteraemia, meningitis, sinusitis, pleural empyema and endocarditis. The protein can also be used to treat infections of the cerebrospinal fluid. The nucleotide sequence encoding the histidyl tRNA synthetase enzyme is useful for therapeutic and prophylactic treatments, particularly for the nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Haselbeck R,

The present sequence represents a novel melanoma associated delayer early response (MADER) protein. This 55 km nuclear protein is associated growth alterations in malignant melanomas and other cancerous conditions, and is over-expressed in human malignant melanomas. Sev variants of the protein have been identified (AAW24229-31), the preprotein being the Drop9 variant. The protein contains repeat motifs are characteristic of gene regulatory NNA hinding protein.

                                                      The present invention provides the protein and coding sequences of 444 novel human proteins. These were isolated from expressed sequences tags (ESTs). They can be used to stimulate cell growth, to regulate haematopoiesis e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat multiple sclerosis, to regulate activin or inhibin e.g. to treat infertility, to regulate haemostasis or thrombolysis e.g. to treat stroke and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. parkinson's disease. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           rearrangement of MADER can be detected by hybridising immobilised chromosomal target DNA, that has been rendered single stranded and is obtained from a cell suspected of having undergone a MADER translocation event with a single stranded oligonucleotide probe complementary to a MADER nucleotide sequence. The probe contains a moiety capable of direct or indirect visualisation. Antibodies raised against the MADER protein can be used for detecting a cancerous condition, particularly melanoma malignancies, and especially a breast carcinoma. A composition comprising a MADER immunogen and a pharmaceutically acceptable vehicle can be used to elicit an immune response against a cell which over-expresses a MADER antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antiinfertility;

                                                                                               밁
                                                                                                                                                                                                                                                                                                                  The present sequence represents a novel melanoma associated delayed CC early response (MADER) protein. This 55 kDa nuclear protein is associated CC with growth alterations in malignant melanomas and other cancerous CC conditions, and is over-expressed in human malignant melanomas. Several CC variants of the protein have been identified (AAW2428-31), the present CC protein being able to bind erg-1 and inhibit its activity. Chromosomal CC rearrangement of MADER can be detected by hybridising immobilised CC chromosomal target DNA, that has been rendered single stranded and is CC obtained from a cell suspected of having undergone a MADER translocation CC event with a single stranded oligonucleotide probe complementary to a CC MADER nucleotide sequence. The probe contains a moiety capable of direct CC indirect visualisation. Antibodies raised against the MADER protein CC can be used for detecting a cancerous condition, particularly melanoma CC malignancies, and especially a breast carcinoma. A composition comprising the clinity and the contains a moiety capable of the can be used for detecting a cancerous condition, particularly melanoma CC malignancies, and especially a breast carcinoma. A composition comprising the contains a moiety capable of the contains a moiety capable of the capable of the contains and especially a breast carcinoma. A composition comprising the contains a moiety capable of the contains and especially a breast carcinoma.

                                                                                                                                                                                                                                                                                                                                                                                                                         polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                         The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.
                                                                                                                                                                                                                                                                                                                    C glutamicum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                organisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant

Tateishi N,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying streptococcus proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for
                                                                                                                                                                                                                                                                                                                                                           Chimera gene; chromosome translocation; t(5;14)(q33;q32); CEV14 gene; platelet-derived growth factor beta receptor; PDGFR-beta.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the chromosome translocation t(5;14)(q33;q32) formed by fusing the CEV14 gene (1-287 basepairs of the present sequence) with a platelet-derived growth factor beta receptor (PDGPR-beta) gene. A method for the detection of a chimera gene produced by t(5;14)(q33;q32) in a sample by preparing cDNA from the DNA or mRNA in the sample as the template and using an oligonucleotide designed to bind the CEV14 gene region of the above chimera and an oligonucleotide designed to bind the PDGPR gene region as the primers and detecting the amplified product formed by the PCR is also provided. The method can detect a gene specific to the presence of t(5;14)(q33;q32) specifically at a high sensitivity. The present sequence represents the PDGFR-beta sequence.
                                                molecules have been determined. Primers for synthesising the full length CDNA are useful for clarifying the function of the protein encoded by the CDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed sequence is the production of the printed sequence.
                                                                                                                                                                                                                                                                           The invention relates to primers for synthesising full length cD clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens

                                                                                                                                                                                                                                                                                                        The MDV gBh of HSV from a BamHI 13 (5.2kb) and K3 (3.6kb) fragment of MDV GA strain was cloned into pUC18. A 2.8kb BamHI-SalI subfragment from 13 fragment and a 1.1kb BamHI-ECORI subfragment from K3 fragment were ligated with EcoRI, SalI digested pUC18. The sequence of the putative MDV gBh was determined by sequencing a set of deletion mutants. The nucleotide and amino acid sequences were found to be identical with the published sequences of the gBh of MBV (Ross etal., J.Gen.Vicol., 70:179-1894, 1988).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 1993-001546/01.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Marek's Disease Virus

                                                                                                                                                                                                                                                                                          This sequence represents the chimeric protein 40 K-C which comprises a fragment of the Marek's disease virus outer membrane protein gB fused to an antigenic protein from Mycoplasma gallisepticum. The chimeric protein can be used in recombinant live vaccines for prevention of infection by Mycoplasma gallisepticum, especially as the outer membrane protein shows antigenicity in poultry.
                                                                                                                                                                                                                                                                                                                                                                                             Fusion protein comprising herpes virus outer membrane protein and antigenic polypeptide - for prevention of infection by Mycoplasma gallisepticum, especially in poultry
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chimeric -

                                                                                                                                                                                                                                                                                                                                                                                                                                       δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags (CC for identifying expressed genes. (I) is useful in gene therapy techniques (CI). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical classified of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity amino acid sequences or other traits to assess biodiversity amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed constitution, but was obtained in electronic format directly from WIPO at the content of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB19912, encoding the protein sequences in AB57020 to AB59714) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition related sequence, which are used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human platelet derived growth factor receptor (see AAN90388) for features). Used to make probes and antibodies, and to evaluate drugs. The regions specified are potential N-glycosylation sites, and the domain is a transmembrane sequence.
Secreted ligand-binding receptor analogues eg - used in assays, in purifications and as, or therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Williams LT,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
The sequence given is one allele of type B human platelet-derived growth factor (PDGF) receptor (PDGF-R). This receptor is typically found on cells of mesenchymal origin. It acts while in the form of two transmembrane glycoproteins, each of which is about 180 kD. This receptor has three major regions. The first is a transmembrane region, which spans the membrane conce, separating the regions of the receptor exterior to the cell from those interior to the cell. The second region is an extracellular region which contains the domains which bind the PDGF. The third region is an intracellular region
                                                                                                                                                                                                                                                                                                                                       Platelet derived growth factor receptor (PDGF-R) poly:peptide(s) - useful as therapeutic and diagnostic agents e.g. for assaying PDGF activity in sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      details). These analogues are easily purified, produced in large quantities recombinantly, used to produce antibodies, to screen ligands as imaging agents, as (ant-)agonists, or therapeutically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Platelet derived growth factor receptor (see corresp. AAN90355). Used in the invention to make analogues that are secreted (pref. Ile-29 - Met-441, and Ile-29 - Lys-531; see specification for details). These analogues are easily provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 1992-299970/36.

                                                                             The amino acid sequence (AAR99690) of human platelet-derived growth factor receptor (PDGF-R) was deduced from a cDNA clone (AAT3452) isolated from a human diploid dermal fibroblast library. The cDNA can be used in novel constructs that allow the prodn. of secreted biologically active PDGF-R analogues. This may comprise linking a sequence coding for PDGR-R, or the ligand-binding domain of the PDGF-R extracellular region, to a protein secretion signal (e.g. SUC2) and promoter, and expression in transformed host cells, esp. Saccharomyces cerevisiae. The secreted PDGF-R analogues are used in ligand screening procedures, to screen for (ant)agonists, and in diagnostic assays.

                                                                                                          CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC is tensione at a sused in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC in justifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences of the invention.

CC diagnostic amino acid sequences of the invention.

                                                                                                          Š
                                                                                                                                                                                                                                The present sequence represents the alpha 1H-2 subunit of a human CC low-voltage activated calcium channel. Alpha 1H-2 subunit cDNA CC (see AAX59082) was obtained by PCR amplification from a TT cell CC CDNA library. The invention provides calcium channel subunits, CI including 2 splice variants of alpha 1H-1 (see AAX60298 and AAY66299), CI dendisoform alpha 1H-2. Relative to alpha 1H-1, the 1H-2 isoform CC contains a 319 amino acid deletion within the intracellular loop contains a 319 amino acid deletion within the intracellular loop contains a 319 amino acid deletion within the intracellular loop contains a 319 amino acid deletion within the intracellular loop contains all cells and tissues axamined. These cleantified by PCR in all cells and tissues examined. These contained TT cels, amygdala, caudate nucleus, putamen, heart, kidney and liver cells. Cells and vectors containing nucleic calcius encoding these calcium channel subunits, and methods for cleantifying compounds that modulate the activity of calcium calcium. Channels that contain these subunits are provided by the invention. Compounds are used to treat calcium channel mediated disorders, including neurological, endocrinological, cardiovascular, curological, hepatic, respiratory and vascular disorders.
                                                                                                                                           Query Match

                                                                                                   5
                                                                                                                                                                                                           RESULT 151
                                                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC for restore normal activity of (II) or to treat disease states involving CC (II), (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

                                                                                                                                                                                                                                                               imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL1016176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                 Disclosure; SEQ ID NO 13971; 21pp + Sequence Listing; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Drosophila melanogaster polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Myers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the the alpha 1H-1 subunit of a human low-voltage activated calcium channel. The sequence was deduced from CDNA (see AAX59080) isolated from a TT cell cDNA library.

The invention provides calcium channel subunits, including 2 splice variants of alpha 1H-1 (see also AAV6299), and isoform alpha 1H-2 (see AAV6300). The 1H-1 splice variants were detected by RT-PCR in multiple tissues. They differ only at amino acid 2230, being either Asp or Glu. 1H-2 has a 319-amino acid deletion in the lire of the AAV6400. The containing nucleic acids encoding these subunits, and methods for identifying compounds that modulate the activity of calcium channels compounds are used to treat calcium channel mediated disorders, including neurological, endocrinological, cardiovascular,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hans M,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 iow-voltage activated calcium channel. The sequence was deduced from cDNA (see AAX59080) isolated from a Tr cell cDNA library. The invention provides calcium channel subunits, including 2 splice variants of alpha 1H-1 (see also AAY06298), and isoform alpha 1H-2 (see AAY06300). The 1H-1 splice variants were detected by RT-PCR in multiple tissues. They differ only at amino acid 2230, being either Asp or Glu. 1H-2 has a 319-amino acid deletion in the I-II intracellular loop relative to 1H-1. Cells and vectors containing nucleic acids encoding these subunits, and methods for identifying compounds that modulate the activity of calcium channel that contain the subunits are used to treat calcium channel mediated disorders, including neurological, endocrinological, cardiovascular,
                                                                                                                                                                                                                                                        Human; calcium channel protein; prostate cancer; Parkinson's disease; CNS; central nervous system disorder; stroke; cardiovascular disorder; hypertension; angina; haematological disorder; thrombosis; pain relief voltage-dependent T-type calcium channel alpha_H subunit; asthma; inflammatory disease; allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 1999-371096/31
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hans M, Harpold M, Williams M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            50
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc human calcium channel protein polypeptide. The polypeptide, color polynucleotide and methods are useful in preventing or treating diseases crelated to calcium channel protein dysfunction, such as cancers (e.g. CC prostate), CNS (central nervous system) disorders (e.g. Parkinson's CC disease, stroke), cardiovascular disorders (e.g. hypertension, angina), CC or haematological disorders (e.g. thrombosis). The expression vector and CC reagent are useful in preparide a medicament for modulating the activity CC of the calcium channel protein in a disease. The methods are also useful in CC in detecting or producing polypeptides and polynucleotides useful CC in detecting or producing polypeptides and polynucleotides useful in CC treating the above diseases, and for screening for agents that regulate the activity of the calcium channel protein. These are also useful in CC treating inflammatory diseases (e.g. asthma, allergy) and in relieving CC pain from the above diseases. The present amino acid sequence represents CC protein. As described in the invention
                                                                                                                                                                                                                             Streptomyces
                                                                                                                                                                                                                                                                 Tylactone synthase gene cluster; tylG gene; multifunctional protein; polyKetide; tylactone synthesis; antibiotic; tylosin; hybrid protein.

This consequence was created by replacing a EcoRI-ApaI fragment of srmG ORF1 with a EcoRI-Sful fragment from tyle ORF1. The position of the residues from the each of the two genes is not given in the specification. The srmG gene cach of the two genes is not given in the specification. The srmG gene control of the two genes is not given in the specification. The srmG gene control of the specification is the specification of the multi-functional proteins which direct the synthesis of the codes control of the multi-functional proteins which direct the synthesis of the size building block of the control of the synthase gene cluster of the invention. The tylG sequence was isolated from Streptomyces fradiae, and encodes multifunctional proteins which direct the synthesis of the polyketide tylactone. Tylactone is the basic building block of the antibiotic tylactone. Tylactone is the basic building block of the antibiotic tylactone. Tylactone is the basic building block of the antibiotic tylactone. Tylactone is the basic building block of the antibiotic tylactone. Tylactone is the basic building block of the antibiotic tylactone. Tylactone is the basic building block of the antibiotic tylactine. The hybrid sequence can be used to transform S. ambofaciens lacking the srmG ORFI sequence, so that they can produce control of the post-condensation reactions performed, thereby the post-condensation reactions performed, thereby the post-condensation reactions performed, thereby

                                                                                                    AAW23716-W23720 represent proteins encoded by the platenolide synthase gene cluster of the invention. The gene cluster is also referred to as the srmG gene, and was isolated from Streptomyces ambofaciens. These sequences are multi-functional proteins which direct the synthesis of the polyketide platenolide. Platenolide is the basic building block of the macrolide antibiotic spiramycin. The DNA can be used to produce compounds exhibiting antibiotic activity based on the platenolide structure, including specifically the macrolide antibiotic spiramycin and spiramycin analogues and derivatives. Modifications of the platenolide synthase DNA sequence can be made so as to change the number and type of carboxylic acids incorporated into the growing polyketide chain and to change the kind of post-condensation processing that is conducted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Platenolide synthase gene multi-functional protein;

Platenolide is the basic building block of the macrolide cantibiotic spiramycin. The DNA encoding this sequence was used along cc with the tylG gene (see AAT80413) to create a hybrid ORF1 sequence (see Cc AAT80415). The tylG gene is the tylactone synthase gene cluster of the clinvention. The tylG gene is the tylactone synthase gene cluster of the cc invention. The tylG sequence was isolated from Streptomyces fradiae, and cc encodes multifunctional proteins which direct the synthesis of the cc polyketide tylactone. Tylactone is the basic building block of the cantibiotic tylosin. The hybrid sequence can be used to transform S. cc ambofaciens lacking the srmG ORF1 sequence, or S. fradiae lacking the tylG ORF1 sequence, so that they can produce polyketides. The DNA csequence can be modified so as to alter the type of carboxylic acids incorporated, the number of carboxylic acids incorporated and/or the cc post-condensation reactions performed, thereby resulting in novel xxx
            cytotoxic T lymphocyte (CTL) inducing epitope from at least one HIV-protein, and comprises examining the nucleic acid sequence in the first 24 weeks after infection, and confirming that an immune response directed against the CTL-inducing epitope is capable of selecting for viral escape variants during the acute phase of HIV infection. The method is useful for designing a rational, novel vaccine
                                                                                                                                                         The sequences given in AAB47748-50 represent epitopes derived from simian immunodeficiency virus (SIV) which were used in the method \alpha

                                                                                                                                                                                                   HIV-protein, and comprises examining the nucleic acid sequence in the first 24 weeks after infection, and confirming that an immune response directed against the CTL-inducing epitope is capable of selecting for viral escape variants during the acute phase of HIV infection. The method is useful for designing a rational, novel vaccine approach to HIV. The method is particularly useful for making an HIV vaccine. This epitope affected acute escape 4 weeks post infection.
                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                    simian immunodeficiency virus (SIV) which were used in the method the invention. The method allows identification of at least one cytotoxic T lymphocyte (CTL) inducing epitope from at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAB47751-60 represent epitopes

                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAB47751-60 represent epitopes derived from simian immunodeficiency virus (SIV) which were used in the method of the invention. The method allows identification of at least one cytotoxic Tlymphocyte (CTL)-inducing epitope from at least one HIV-protein, and comprises examining the nucleic acid sequence in the first 24 weeks after infection, and confirming that an immune response directed against the CTL-inducing epitope is capable of selection. The method is useful for designing a rational, novel vaccine approach to HIV. The method is particularly useful for making an HIV internal that the courter phase of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying CTL-inducing epitope(s) from HIV protein, useful for making an HIV vaccine, comprises determining the immune response against the epitope in order to select viral escape variants during the first 24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 2; Page 66; 85pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Saccharomyces cerevisiae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 5; Page 452; 488pp; English.

                                                                                                                        This sequence represents the modified portion (aa214-224) of T7 DNA polymerase modified by the substitution of His 218 for Ser. This gives polymerase with little or no associated exonuclease activity, does not discriminate against nucleotide analogue incorporation and can utilise small oligonucleotides as specific primers. These are ideal properties for the manipulation of DNA, partic. for sequencing since the background level of radioactivity in the PACE gels is negligible, there are few or no artificial bands, and the bands are sharp. Such a polymerase allows novel methods of sequencing long DNA fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from

```

```
This sequence comprises the protein binding region on c-Fos which corresponds to amino acids 226-236 of the mature protein. The peptide can be useful for the competitive inhibition of naturally occurring c-Fos in situations where it may be desirable to decrease the amount of c-Fos activation by phosphorylation by a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 c-Fos regulating protein kinase phosphorylates c-Fos - acts
potentiates its activity, used to treat a cell proliferation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Soluble VCAM is naturally present in human serum and plasma. Purification of soluble VCAM from plasma on a monoclonal antibody affinity column reveals three species with mol. wt. of 100kD, 80kD and 40kD. N-terminal sequence analysis of the first 10 residues of the 100kD form (AAR34443) identified the material as being identical to the N-terminus of the published sequence of membrane bound VCAM.
                                                        Determining the presence of neoplastic molecular markers, by identifying the presence of markers in host test sample using array of neoplastic molecular marker specific reagents and analyzing the array of the reagents
